

## **Individual Project Tools**

The tools that are planned to be used so far are clubhouse, github, vscode, xampp, and PhpMyAdmin.

Clubhouse is a platform to organize tasks amongst groups. Although this extension is being developed single-handedly, it still is a platform to keep future work neat and documented

Github will be used to hold all code and documentation for the extension.

Vscode is the editor chosen to work on all the code. It is simple and allows for easy pushes and pulls to the github repository.

Xampp is a database and server hosting form. The combo allows for a smooth transition that should be less prone to errors and allows for quicker development.

PhpMyAdmin is a database editor platform that is integrated into Xampp.

## **Languages Used**

1. Html
2. Javascript
